

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously presented) A computer software program recorded on a machine-readable medium and containing machine readable instructions for execution by an electronic processor to provide a database management system in accordance with a database management schema, the schema comprising:
 - a first table to store the names of various entity types;
 - a second table related to the first table to store the names of entities of the various entity types;
 - a third table related to the first table to store the names of fields in respect of the various entity types;
 - one or more value storage tables related to the second and third tables to associate stored field values with entities; and
 - identifiers to indicate the nature of the data to be stored in each of said tables.
2. (Previously presented) A computer software program according to claim 1, wherein the schema includes a first hierarchical relationship applied to the first table and a second hierarchical relationship applied to the second table to facilitate definition of hierarchical entities.
3. (Previously presented) A computer software program according to claim 1, wherein the schema includes tables to store relationships between the entities.
4. (Previously presented) A computer software program according to claim 1, wherein the first table includes a column to store pointers corresponding to entity types the pointers indicating locations from which default values may be obtained during creation of new instances of the entity types.
5. (Previously presented) A computer software program according to claim 1, wherein the third table includes a column to store data indicating that a newly created entity's name is to be generated from data stored in columns of the one or more value storage tables.

6. (Previously presented) A computer software program according to claim 1, wherein the one or more value storage tables comprise a number of value tables each including a column of values of a particular type.
7. (Previously presented) A computer software program according to claim 6, wherein one or more of the value tables are each related to one or more other tables of the schema.
8. (Previously presented) A computer software program according to claim 7, wherein the one or more of the value tables are each related to the second table.
9. (Previously presented) A computer software program according to claim 8, wherein the one or more of the value tables are arranged to store pointers to data stored external to data structures created by the computer software program.
10. (Previously presented) A computer software program according to claim 6, wherein the schema includes a data type table relating names of the value storage tables to corresponding names of the column of values of a particular type.
11. (Previously presented) A computer software program according to claim 10, wherein the data type table is related to the third table.
12. (Previously presented) A computer software program according to claim 11, wherein the data type table is related to an intermediate value type table and wherein the value type table points to the third table.
13. (Previously presented) A computer software program according to claim 1, wherein the third table includes columns to define multiple field functionality.
14. (Previously presented) A computer software program according to claim 6, wherein the third table includes a column to indicate if historical data values are to be stored in respect of a corresponding field type and wherein the value storage tables each include a column to store current values of said field type and to store data indicating when the current values were written.
15. (Previously presented) A computer software program according to claim 6, wherein the third table includes a column to store values indicating whether or not values of a newly created instance of an entity are to be inherited from another instance of an entity.
16. (Previously presented) A computer software program according to claim 6, wherein the schema includes a format table having columns to store data storage formats.

17. (Previously presented) A computer software program according to claim 6, wherein the schema includes one or more tables to store values indicating groupings of sets of fields.

18. (Previously presented) A method implemented by means of an electronic processor to store data in tables of a database management schema, the data concerning a number of entities of various entity types and relationships between the various entity types, the method comprising the steps of:

- storing identifiers of each of the entity types in a first table of the database management schema;

- storing identifiers of each of the number of entities in a second table related to the first table;

- storing identifiers of each of a number of field types for the various entity types in a third table related to the first table; and

- storing field values associated with the entities in one or more value storage tables related to the second and third tables.

19. (Original) A method according to claim 18 further including:

- storing hierarchical entities by applying a first hierarchical relationship to the first table and a second hierarchical relationship to the second table.

20. (Original) A method according to claim 18 further including:

- storing data in one or more tables defining relationships between the entities.

21. (Previously presented) A method according to claim 20, wherein the step of storing data defining relationships includes:

- storing data identifying various relationship types in a fourth table; and

- storing data identifying relations in a fifth table.

22. (Original) A computational device operated according to the method of claim 18.
